

Feasibility report

ANALYSATION OF THE PROJECT TO SEE WHAT PARTS ARE FEASIBLE,
WHAT THE PROJECT HOPES TO ACHIEVE AND WHAT LIMITS IT

Potential legal issues;

- ▶ Copyright designs and patterns act – any images or sound used must be self made or using one with the appropriate Creative Commons licence
- ▶ Data protection act – need students data to be secure, only take what's necessary.
- ▶ Computer misuse act – must be certain the app cannot be misused to cause serious damages by those with malicious intent

Technological requirements;

- ▶ Needs to be able to run smoothly on lower spec devices as some will have school provided devices which are quantity over quality.
- ▶ Should keep with app norms to increase of learning so it does not take additional time to learn the app rather than the language
- ▶ Should be easy for teachers to provide support for students to assist their learning
- ▶ Preferably should run 24/7 as there will be no exact time where all users are online

Financial and social costs of development and potential benefits;

Type	Potential Benefits	Potential Costs
social	• Increased student engagement • Improved student performance due to personal targeted learning • Better performance tracking	Depending on how it is marketed students may not want to engage with the app May struggle to grow outside of the school
Financial	• Likely increased amount of students therefore increased profits • Potentially faster course times therefore more students per year	Labour costs for app creation and maintenance Hardware/software upgrades/purchases Staff training costs

scheduling and resources

- ▶ Time -The project will take 2 months to complete the prototype with plans to expand in the future,
- ▶ Resources required:
- ▶ Computers – these will be required to create the app as well as to gauge how high processing power the app will be expected to run at; as the app would be useless if it was too high spec for students devices to run it
- ▶ Data server – this will be required to store the larger data files for example all usernames and respective passwords, each users usage data.

operational impact;

- ▶ Support – users will receive an instruction guide and they will be able to provide feedback from within the app and the admins can review these requests and consider their suggestions for changes
- ▶ Operation requirements - the operators need to be able to program in the chosen programming language, will need ongoing maintenance for app feedback, bug fixing and functional improvements.

Possible solutions to each requirement

requirement	solution1	Solution 2	Best solution and why
Include point system	Grant points after each task shall prioritize quality of completed tasks	Grant points after each task shall prioritize quantity of completed tasks	Solution2 is the best for this app because the client desires the app to be engaging and for the students to use the app as much as possible and solution 2 supports this
Record playback and submission system	After making a recording the student chooses whether to submit the recording and or listen to it	After making a recording the recording is automatically submitted and they can listen to the recording	Solution1 is the best because it gives the student the right to not share a form of information when they don't want to and the students will probably use the function less if the submission was automatic
Progress and usage viewable by admins	View each student data individually through tabs	View all students data together in a spreadsheet	Solution 2 all data through averages and can view students usage data all in one place in a spreadsheet is best due to several perspectives to analyse data and it is more
Make Memory game	Match game where you reveal 2 then those 2 hide if incorrect after a couple seconds and stay shown	Match game where you reveal 2 then hide the 1 st if incorrect and stay shown	Solution 2, we will likely use a timer within the game and the wait times for solution 1 to show then re-hide would slow things down a lot and could feel quite clunky
Make Speed game	Generate a 'question' and many answers quickly choose the answer that matches the question then generate a new question continuing till the time runs out	Generate a 'question' and 2 possible answers, pick the correct answer and then another question and 2 answers will be generated, until time runs out	Solution 1 because it constantly exposes them to lots of the words at the same time and are more likely to associate the question with the answer then learn based on elimination
Make Practise game	Works like flashcards with the English and their native language = can scroll between them to have a look and listen	Randomly chooses a word and shows in English and native language, can look and listen and when they want to move on randomly generates a different word	Solution 1 because it gives the user more control over what they're learning and if they want to practise a specific word it won't be hard to find the word
